

COLLEGE ADMISSION MANAGEMENT SYSTEM

**A Project Report Submitted
In Partial Fulfillment of the Requirements
for the Degree
of**

MASTER OF COMPUTER APPLICATION

**by
Yash Vashishtha
(1900290140042)**

**Under the Supervision of
Mrs. Vidushi
(Assistant Professor)
KIET Group of Institutions, Ghaziabad**

**to the
FACULTY OF MCA**

**DR. APJ ABDUL KALAM TECHNICAL UNIVERSITY
(Formerly Uttar Pradesh Technical University) LUCKNOW**

DECLARATION

I hereby declare that the work presented in this report entitled “COLLEGE ADMISSION MANAGEMENT SYSTEM”, was carried out by me. I have not submitted the matter embodied in this report for the award of any other degree or diploma of any other University or Institute.

I have given due credit to the original authors/sources for all the words, ideas, diagrams, graphics, computer programs, experiments, results, that are not my original contribution. I have used quotation marks to identify verbatim sentences and given credit to the original authors/sources.

I affirm that no portion of my work is plagiarized, and the experiments and results reported in the report are not manipulated. In the event of a complaint of plagiarism and the manipulation of the experiments and results, I shall be fully responsible and answerable.

Name : YASH VASHISHTHA

Roll. No. : 1900290140042

Branch : Master of Computer Application

COMPUTER EDUCATION
Expert in Programming Languages

TO WHOM IT MAY CONCERN

This is to certify that **Mr Yash Vashishtha s/o Mr Praveen Kumar Sharma**, has successfully completed his training from 20/01/2022 to 20/05/2022 on project titled **“College Admission Management System”**. During his training, we found him to be respectful, efficient and a good performer.

Thanking You

With regards

REG. NO. 1/1398

Estd. 2000

REGD. 1/1398

Date: 21-5-2022

Address : Main Road, Dwarikapuri, Muzaffarnagar (U.P.)
Phone : 9927238580
Email: nbcmzn@gmail.com

CERTIFICATE

Certified that **Yash Vashishtha** (enrollmentno1900290140042) has carried out the project work presented in this thesis entitled “**College Admission Management System**” for the award of **Master of Computer Application** from Dr.APJ Abdul Kalam Technical University, Lucknow under my supervision. The thesis embodies results of original work, and studies are carried out by the student herself and the contents of the thesis do not form the basis for the award of any other degree to the candidate or to anybody else from this or any other University.

Mrs. Vidushi

(Internal Examiner)

Assistant Professor

Dept. of Computer Applications

KIET Group of Institutions, Ghaziabad

External Examiner

ACKNOWLEDGEMENT

Success in life is never attained single handedly. My deepest gratitude goes to my thesis supervisor, **Mrs. Vidushi** for her guidance, help and encouragement throughout my project work. Their enlightening ideas, comments, and suggestions.

Words are not enough to express my gratitude to **Dr. Ajay Kumar Shrivastava**, Professor and Head, Department of Computer Applications, for his insightful comments and administrative help at various occasions.

Fortunately, I have many understanding friends, who have helped me a lot in many critical conditions.

Finally, my sincere thanks goes to my family members and all those who have directly and indirectly provided moral support and other kinds of help. Without their support, completion of this work would not have been possible in time. They keep my life filled with enjoyment and happiness.

Yash Vashishtha

Enrollmentno-1900290140042

CHAPTER 1

INTRODUCTION

1.1 PROJECT DESCRIPTION

Today all the work at the time of admission of the students is done manually by ink and paper, which is very slow and consuming much efforts and time. In the modern world of technology, computer are affecting our lives in more ways than we probably are aware of. COMPUTERIZED MANAGEMENT maintaining information of an educational institute, colleges, other the list is endless. The main principle behind the need of college admission system is easy supervision of institutes. It can handle the details of students such as personal details or admission details. This Student Database has been designed taking into account the practical needs to manage a Students data. Moreover, it provides security at product level as well as user level. Its design concentrates on 2 types of users:

1. Admin
2. Students

1.2 PROJECT SCOPE

The main goal of the system is to automate the process carried out in the organization with improved performance and realize the vision of paperless admission. Some of the goals of the system are listed below:

- ☐ Manage large number of student details.
- ☐ Manage all details of student who registered for the course and send appropriate details about the course to the students account.
- ☐ Create student accounts and maintain the data's effectively.
- ☐ View all the details of the students.
- ☐ Create the statistical reports.

- Reduce the work load in interview the students for selection and Counseling should be very effective rather than direct methods.

1.3 Hardware / Software used in Project

1.3.1 Hardware Requirements

The most common set of requirements defined by any operating system or software application is the physical computer resources, also known as hardware. Memory – All software, when run, resides in the random access memory (RAM) of a computer. Memory requirements are defined after considering demands of the application, operating system, supporting software and files, and other running processes. Optimal performance of other unrelated software running on a multi-tasking computer system is also considered when defining this requirement.

| Number | Description |
|--------|----------------------------------|
| 1 | PC with 250 GB or more Hard disk |
| 2 | PC with 2 GB RAM. |
| 3 | PC with Pentium 1 and above |

Table 1.1

1.3.2 Software Requirements

The software requirements are description of features and functionalities of the target system. Requirements convey the expectations of users from the software product. The requirements can be obvious or hidden, known or unknown, expected or unexpected from client's point of view .Every project needs

software. We should try to understand what sort of requirements may arise in the requirement elicitation phase and what kinds of requirements are expected from the software system.

| Number | Description | Type |
|--------|------------------|----------------------|
| 1 | Operating System | Windows XP / Windows |

| | | |
|---|----------|--------------------------------------|
| 2 | Language | JavaScript, HTML, CSS |
| 3 | Database | MySQL |
| 4 | PDI | Service Now |
| 5 | Browser | Google Chrome / Internet Explorer |

Table 1.2

CHAPTER 2

TECHNICAL FEASIBILITY

2.1 INTRODUCTION

Feasibility of the system is an important aspect, which is to be considered. The system needs to satisfy the law of economic, which states that the maximum output should be yielded in minimum available resources.

A feasibility analysis evaluates the project's potential for success; therefore, perceived objectivity is an essential factor in the credibility of the study for potential investors and lending institutions. There are five types of feasibility study separate areas that a feasibility study examines, described below.

2.1.1 Technical Feasibility

This assessment focuses on the technical resources available to the organization. It helps organizations determine whether the technical resources meet capacity and whether the technical team is capable of converting the ideas into working systems. Technical feasibility also involves the evaluation of the hardware, software, and other technical requirements of the proposed system. As an exaggerated example, an organization wouldn't want to try to put Star Trek's transporters in their building currently, this project is not technically feasible.

2.1.2. Economic Feasibility

This assessment typically involves a cost/ benefits analysis of the project, helping organizations determine the viability, cost, and benefits associated with a project before financial resources are allocated. It also serves as an independent project assessment and enhances project credibility—helping decision-makers determine the positive economic benefits to the organization that the proposed project will provide.

2.1.3. Legal Feasibility

This assessment investigates whether any aspect of the proposed project conflicts with legal requirements like zoning laws, data protection acts or social media laws. Let's say

an organization wants to construct a new office building in a specific location. A feasibility study might reveal the organization's ideal location isn't zoned for that type of business.

That organization has just saved considerable time and effort by learning that their project was not feasible right from the beginning.

2.1.4. Operational Feasibility

This assessment involves undertaking a study to analyze and determine whether and how well the organization's needs can be met by completing the project. Operational feasibility

studies also examine how a project plan satisfies the requirements identified in the requirements analysis phase of system development.

i. Scheduling Feasibility

This assessment is the most important for project success; after all, a project will fail if not completed on time. In scheduling feasibility, an organization estimates how much time the project will take to complete.

When these areas have all been examined, the feasibility analysis helps identify any constraints the proposed project may face, including:

- Internal Project Constraints: Technical, Technology, Budget, Resource, etc.
- Internal Corporate Constraints: Financial, Marketing, Export, etc.
- External Constraints: Logistics, Environment, Laws, and Regulations, etc.

2.2 TECHNOLOGY DESCRIPTION

2.2.1 HTML

HTML stands for HyperText Markup Language. It is used to design web pages using a markup language. HTML is the combination of Hypertext and Markup language. Hypertext defines the link between the web pages. A markup language is used to define the text document within tag which defines the structure of web pages. This language is used to annotate (make notes for the computer) text so that a machine can understand it and manipulate text accordingly. Most markup languages (e.g. HTML) are human-readable. The

language uses tags to define what manipulation has to be done on the text.

HTML is a markup language used by the browser to manipulate text, images, and other content, in order to display it in the required format. HTML was created by Tim Berners-

Lee in 1991. The first-ever version of HTML was HTML 1.0, but the first standard version was HTML 2.0, published in 1995.

2.2.2 CSS

CSS is a style sheet language used for describing the presentation of a document written in a markup language such as HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility; provide more flexibility and control in the specification of presentation characteristics; enable multiple web pages to share formatting by specifying the relevant CSS in a separate .css file, which reduces complexity and repetition in the structural content; and enable the .css file to be cached to improve the page load speed between the pages that share the file and its formatting.

Separation of formatting and content also makes it feasible to present the same markup page in different styles for different rendering methods, such as on-screen, in print, by voice (via speech-based browser or screen reader), and on Braille-based tactile devices. CSS also has rules for alternate formatting if the content is accessed on a mobile device.

The name *cascading* comes from the specified priority scheme to determine which style rule applies if more than one rule matches a particular element. This cascading priority scheme is predictable.

The CSS specifications are maintained by the World Wide Web Consortium (W3C). Internet media type (MIME type) `text/css` is registered for use with CSS by RFC 2318 (March 1998). The W3C operates a free CSS validation service for CSS documents.

2.2.3 PHP

The term PHP is an acronym for **Hypertext Preprocessor**. It is a server-side scripting language that is used for web development. It can be easily embedded with HTML files. HTML codes can also be written in a PHP file. The PHP codes are executed on the server-side whereas HTML codes are directly executed on the browser.

It is one of the widely used open-source general-purpose scripting language that is used for backend Development. Apart from this, let's see why we should learn it.

Easy to Learn: It is easier to learn for anyone who has come across to any programming language for the first time.

Free of Cost: Since it is an open-source language, therefore developers are allowed to use its components and all methods for free.

Flexible: Since It is a dynamically typed language, therefore there are no hard rules on how to build features using it.

Supports nearly all databases: It supports all the widely used databases, including MySQL, ODBC, SQLite etc.

Secured: It has multiple security levels provides us a secure platform for developing websites as it has multiple security levels.

Huge Community Support: It is loved and used by a huge number of developers. The developers share their knowledge with other people of the community that want to know about it.

2.2.4 MYSQL

MySQL server is a open-source relational database management system which is a major support for web based applications. Databases and related tables are the main component of many websites and applications as the data is stored and exchanged over the web. Even all social networking websites mainly Facebook, Twitter, and Google depends on MySQL data which are designed and optimized for such purpose. For all these reasons, MySQL server becomes the default choice for web applications.

MySQL server is used for data operations like querying, sorting, filtering, grouping, modifying and joining the tables. Before learning the commonly used queries, let us look into some of the advantages of MySQL.

2.3 TECHNOLOGY USED

2.3.1 HTML

HTML stands for HyperText Markup Language. It is used to design web pages using a markup language. HTML is the combination of Hypertext and Markup language. Hypertext defines the link between the web pages. A markup language is used to define the text document within tag which defines the structure of web pages. This language is used to annotate (make notes for the computer) text so that a machine can understand it and

manipulate text accordingly. Most markup languages (e.g. HTML) are human-readable. The language uses tags to define what manipulation has to be done on the text.

HTML is a markup language used by the browser to manipulate text, images, and other content, in order to display it in the required format. HTML was created by Tim Berners-Lee in 1991. The first-ever version of HTML was HTML 1.0, but the first standard version was HTML 2.0, published in 1995.

Output Screen

The image shows a 'CAMS User Login' form. At the top, it says 'CAMS User Login' and 'Login'. Below this are two input fields: 'Registered Email or Contact Number' with an envelope icon and 'Password' with a key icon. There are two buttons: a blue 'Login' button with a person icon and a red 'Register' button with a lock icon. Below the 'Login' button is a link that says 'Forgot password?'.

CHAPTER 6

TESTING

6.1 Unit Testing

The software units in a system are modules and routines that are assembled and integrated to perform a specific function. Unit testing focuses first on modules, independently of one another, to locate errors. This enables, to detect errors in coding and logic that are contained within each module. This testing includes entering data and ascertaining if the value

matches to the type and size supported by java. The various controls are tested to ensure that each performs its action as required.

6.2 Integration Testing

Data can be lost across any interface, one module can have an adverse effect on another, sub functions when combined, may not produce the desired major functions. integration testing is a systematic testing to discover errors associated within interface. The objective

is to take unit tested modules and build a program structure. All the modules are combined and tested as a whole. Here the Server module and Client module options are integrated and tested. This testing provides the assurance that the application is well integrated functional unit with smooth transition of data.

6.3 User Acceptance Testing

User acceptance of a system is the key factor for the success of any system. The system under consideration is tested for user acceptance by constantly keeping in touch with the system users at time of developing and making changes whenever required.

CHAPTER 7

LIMITATION

7.1 Limitation

The drawbacks in Student Management System software can be counted on fingers; with mostly only benefits, these systems have a few countable downsides. Often, applications face minor technical glitches and these systems are no exception but, ratification is immediate. Only, people who are accustomed to regular use of smartphones or computers can operate this software. Extensive modules and features make it difficult for a user to utilise the application.

With huge flow in traffic the application is prone to performance issues. Few companies market their products at extravagant price, which are not affordable by growing organizations. Absence of proper internet-network makes it difficult for a user to access information, which is a significant disadvantage. The risk of data mishandling might be bothersome; but all these drawbacks can be evaded by choosing proper, cost-efficient and best software that best benefits an organization.

7.2 Future scoope

streamlined processes in the apps with built-in features that allow for operational effectiveness, automatic upgrades and uniform compliance. Streaming of the process will include calibration that works for all departments and for all the users across the levels. This will ensure that redundant data entry work is eliminated along with any with unnecessary sub-systems and processes that complicate The use of software for school management will ensure that schools in the future have administrative work in institutions

CHAPTER 8

CONCLUSION

In this way we are going to develop college admission system, which is helpful for Reduction in manual work so less manpower required. Students' records can be accessed within few seconds, Clarity in account section. Our system primarily focuses on building an efficient and user friendly communication system for the educational institutions.
